

Project XTC – Development Edition 0.1

Chapter 12 v2.0 – Browser Mode: Finding Sounds Without Breaking Your Flow

Browser Mode is one of the most useful workflow features provided by DrivenByMoss. Instead of breaking your concentration to reach for the mouse, you can browse instruments, effects and presets directly from the X-Touch. It complements the keyboard and mouse rather than replacing them.

Entering Browser Mode

On the Behringer X-Touch, press the USER button in the GLOBAL VIEW section. This opens Bitwig's Browser and switches the controller into Browser Mode.

This behaviour has been verified on a Behringer X-Touch running firmware 1.22 with DrivenByMoss 26.x and Bitwig Studio 6.1.

Important

There is no button labelled BROWSER on the X-Touch. The Browser function is accessed by pressing USER in the GLOBAL VIEW section. This is one of the easiest features to miss when reading generic MCU documentation.

What Changes?

When Browser Mode opens: The Bitwig Browser appears. The scribble strips change to browser-related functions. The V-Pots and buttons are temporarily reassigned for browsing. Mixer and Device Mode controls are restored when Browser Mode is exited.

A Practical Workflow

1. Press SELECT on the destination track.
2. Press USER.
3. Browse instruments, effects or presets.
4. Preview sounds where appropriate.
5. Load the selected item.
6. Continue working in Bitwig.

Previewing Sounds

Whenever possible, audition presets before loading them. Choosing sounds by listening rather than by name usually leads to quicker and more confident creative decisions.

Reality Check

If the encoders no longer adjust mixer or Device Mode parameters after pressing USER, nothing has gone wrong. The controller is now operating in Browser Mode. Exit Browser

Mode to return to your previous workflow.

Field Note #015

One press of USER is sufficient to enter Browser Mode on the Behringer X-Touch. Although DrivenByMoss documentation refers to the MCU USER function, the physical button on the X-Touch is simply labelled USER in the GLOBAL VIEW section.

Exercise

Create a new instrument track. Press SELECT, then USER, browse several instruments, audition them and load your favourite. Repeat the exercise until opening the Browser becomes a natural part of your workflow.

Key Takeaways

- Press USER to enter Browser Mode.
- Always select the destination track first.
- Read the scribble strips for the current browser functions.
- Browser Mode reduces interruptions without replacing the mouse.

Before You Continue...

The next chapter brings together everything you have learned so far and demonstrates a practical mouse-light workflow using the X-Touch with Bitwig and DrivenByMoss.
