

Project XTC – Development Edition 0.1

Chapter 14 – Where to Go from Here

By this point you should be comfortable navigating Bitwig with the X-Touch, selecting tracks, using PLUG-IN for Device Mode, opening Browser Mode with USER, controlling transport, and understanding how DrivenByMoss changes the behaviour of the surface. The remaining journey is less about learning buttons and more about developing your own workflow.

Make It Your Own

Every studio is different. Spend time refining Bitwig Remote Controls, experimenting with bank layouts and discovering which tasks feel better on the X-Touch than with a mouse. There is no single 'correct' workflow—the best workflow is the one that keeps you creating music.

Keep Exploring

DrivenByMoss is actively developed, and Bitwig continues to evolve. New versions may add features or alter button assignments. Treat this guide as a foundation and keep an eye on release notes when updating your software.

Future Editions of Project XTC

Planned topics include: Advanced automation techniques. Designing effective Remote Control pages. Working with third-party CLAP and VST3 plug-ins. Marker navigation and project management. Custom function keys and macros. A complete button and shortcut reference.

Final Field Note #017

The best way to learn the X-Touch is to use it every day. Small, repeated sessions build confidence far more effectively than trying to memorise every feature at once.

Closing Thoughts

Project XTC began as a practical guide to connecting an X-Touch to Bitwig. It has grown into a handbook built from real-world testing, verified workflows and careful editing. Thank you for being part of that process.
