

Project XTC – Development Edition 0.1

Chapter 6 – The V-Pots

Why V-Pots Matter

The eight rotary encoders, often called V-Pots, are the most versatile controls on the X-Touch. Unlike ordinary knobs, they have no fixed start or end position, allowing DrivenByMoss to assign them to different tasks instantly.

LED Rings

Each V-Pot is surrounded by an LED ring. In Mixer mode it often represents pan, with the centre LED indicating the centre position. In other modes it may show a bar or single position depending on the parameter.

One Control, Many Jobs

In Mixer mode the V-Pots usually control pan. In Device mode they control Bitwig Remote Controls or device parameters. In Sends mode they adjust send levels. Always read the scribble strip before turning an encoder.

Working Efficiently

Develop the habit of glancing at the scribble strips first, then making the adjustment. This reduces mistakes and quickly builds confidence.

Field Note #008

If a V-Pot suddenly stops controlling pan, it almost certainly hasn't. You have probably changed mode.

Exercise

Load Polymer, enter Device mode and adjust each V-Pot while watching the scribble strips and LED rings update together.

Key Takeaways

- V-Pots are endless encoders.
- Their function depends on the current mode.
- The LED rings and scribble strips always provide context.
