

The Unofficial Behringer X-Touch Companion

Edition 0.3 - Draft

Chapter 3 - The Transport Section

The transport controls are where most users first discover the pleasure of using a hardware control surface. Once your hands stay on the X-Touch instead of reaching for the mouse, playback, recording and navigation become noticeably more fluid.

3.1 The Core Controls

The six controls you'll use constantly are REWIND, FAST FORWARD, STOP, PLAY, RECORD and LOOP. DrivenByMoss maps these directly to Bitwig's transport so that pressing a button has the same effect as clicking the equivalent control on screen.

A Better Way to Think

Don't think of the transport as six separate buttons. Think of it as the command centre for your session. Your left hand can start playback, drop into record, stop, loop a section and move around the timeline without ever leaving the controller.

Why?

Professional control surfaces are designed to minimise context switching. Every time you reach for the mouse you interrupt your physical workflow. The transport section reduces that interruption, allowing you to stay focused on what you hear rather than where the cursor is.

Try it Now

Open an existing Bitwig project. Start playback with PLAY. Stop with STOP. Enable LOOP and repeat a short section while adjusting a channel fader. Notice that you never need to look away from the controller once playback has begun.

Gotcha!

If the transport buttons stop responding but the faders still move, first confirm that DrivenByMoss is still active in Bitwig's Controller settings. A working motor fader does not necessarily mean every MCU message is reaching the extension.
