

Project XTC

Working Papers 011-013
Combined Preview Edition

Working Paper 011 – Browser Mode

Browser Mode is one of the biggest workflow improvements offered by DrivenByMoss. Instead of treating Bitwig's Browser as something that belongs to the computer screen, it becomes something you can navigate directly from the X-Touch.

The goal is not to eliminate the monitor, but to keep your hands on the controller. Search, browse, audition and load, then return immediately to performance.

Mental Model

Think of Browser Mode as changing the X-Touch from a mixing console into a librarian. Its job is to help you find the right sound as quickly as possible.

Working Paper 012 – Banking Through Large Projects

Large Bitwig projects may contain dozens—or hundreds—of tracks. The X-Touch does not try to show them all at once. Instead, it presents a moving eight-channel window.

Use BANK to jump eight tracks at a time and CHANNEL to move one track at a time. Experienced users think in terms of 'where is my window?' rather than 'where is track 37?'.

Field Note #004

If you become lost in a large session, press SELECT on the desired track in Bitwig. DrivenByMoss will normally bring the X-Touch's attention back to that part of the project.

Working Paper 013 – Building a Mouse-Free Workflow

The real power of the X-Touch is not replacing the keyboard or replacing the mouse. It is reducing the number of times you need either one.

A typical session might look like this:

- Select a track.
- Enter Device Mode.
- Shape the sound.
- Return to Mixer Mode.
- Record automation.
- Move to the next track.

Notice how the mouse appears only when genuinely useful.

Key Takeaways

- Stay aware of the selected track.
- Stay aware of the current mode.
- Read the scribble strips before touching a control.
- Let the controller become part of your musical thought process.
